

Option 4: One MedImage Server in each practice, sharing photos on a shared Windows drive

Pros:

- No software to be written.
- Only a standard Windows installer need be installed once, in each practice.
- Central administrators e.g. a Primary Health service, can set up their own proxy server, with their own security, and on their own network. Or an AtomJump proxy can be used.

Cons:

- A two step process to get the photos onto the main application.
