

## Setup Instructions for MedImage (Using a Proxy)

**Note:** this guide assumes your System Admin have set up your MedImage 'proxy' server. They will give you an address looking like 'https://myproxy.mycompany.com:5566' (with different numbers or letters in green).

If this is not the case, or you *are* the System Admin, we recommend you read the guide to set your proxy server up at <http://medimage.co.nz/technical-guide/>. Then forward this document on to the people installing the software at each site.

### Step 1

- On your Windows PC, go to the address <http://medimage.co.nz> in your browser.
- Click '**Download**' in the top right corner, and select the correct type of server. This will download the 'server' to your PC.
- Double click to **open the downloaded file** (how to do this will vary slightly depending on whether you are in Internet Explorer, Edge, Firefox or Chrome). You will be guided by the installer to complete setting up the server.
- Inside the MedImage server, click the 'View Details' under the large '**Your Server**' button on the right, and enter the address of your proxy (you can still choose a proxy from AtomJump, with 500MB free bandwidth, by clicking the 2nd 'AJ' button).
- You should get a 4 digit unique **pairing code**. This will be valid for 1 hr.

### Step 2

- On your Android phone, open Google Play, or if you have an iPhone open the App-store. Search for 'medimage' or 'atomjump medimage'. **Purchase the app** and then install it.
- **Run the app**, and click the large button. It will ask you for your 4-digit pairing code from above.
- **Take a photograph.**
- Then when prompted by the app you should see the photo appear on your PC, in the folder you selected when installing the server, within File Manager.
